

occupation and reservation of workplaces and meeting rooms

1. Real-time insight into occupation of workplaces and meeting rooms
2. Management information
3. Reservation tool
4. Person search system

TROTS presents you the online platform iBASX. With iBASX we want to contribute to sustainability by making optimal use of buildings, avoid wastage and reduce CO₂ emissions. Using iBASX, we will also disclose information to end users using an App, to contribute to an enjoyable day!

Real-time insight into occupation of workplaces and meeting rooms

The iBASX cloud offers a platform where real-time data is collected and insight is given in the occupation of workplaces. This data is processed and converted into useful information for the building user and facility manager. This real-time data can be collected via various methods, for example the iBASX sensor technology. It is also possible to unlock other data sources through iBASX, for example via light sensors.

Building users can find a suitable, available (type of) workplace or room quickly on a clear 2D/3D floor map. The information is accessible on any device, anytime and anywhere. The facility manager receives objective insight into the building use and can convert the collected data to usable management information. This makes it possible to:

- reduce costs by more efficient and effective use of the real estate and available facilities;
- sustainable exploitation by avoiding energy waste.

imagine ...

Your company is growing and the number of employees is increasing rapidly. The question arises whether there are sufficient facilities available to accommodate this number of employees.

Using the reporting tool in iBASX you quickly receive an objective and reliable insight into the occupation of the rooms and workplaces over the last period. With these generated graphs you substantiate your advice to the board. That same afternoon you present the advice.

Based on your advice the right decisions are made immediately. Your housing can meet the current needs of all stakeholders and the new employees can be welcomed quickly!

Management information

All collected information on the occupancy of the work environment is stored in the iBASX platform. Via the online reporting tool, this data is easily converted into useful management information. The tool provides a range of options such as:

- the period on which is reported (per minute, per hour, per weekday, weekly, monthly and annually);
- the elements on which is reported (per building, floor/wing, room, organisation/department);
- the type of element such as deskwork, communication, meeting;
- subtype of element such as an enclosed single, double or multiple person room.

Reservation tool

With the reservation tool it is possible to use any device, anywhere and anytime to book workplaces, facilities, etc.

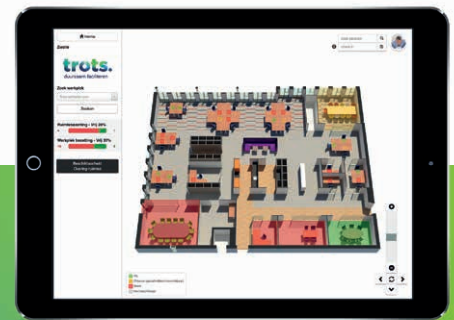

By using sensor technology in the meeting rooms, in addition to the reservation tool, you get an understanding of no-shows and ad hoc use. With this information and the iBASX tools (automatic release on no-show, alerts, etc.) you can actively manage efficient use of space.

The meeting rooms can be equipped with a touchscreen room display. On the display the actual occupancy and reservations are visualised. It is also possible to make a reservation on the display.

Person search system

Finding your colleagues is done with the person search system of iBASX. By checking yourself in at a workplace, meeting room, location, etc. you are findable. The choice to make yourself findable is up to you, this makes iBASX privacy proof.

Real-time insight in the occupancy of workplaces and meeting rooms

the benefits of iBASX

- Objective and reliable measurement, the sensors register the occupation independently. Therefore iBASX is independent of any action or compatible device of the end user.
- Registration of the occupancy at a workplace level.
- Anonymity guaranteed, there is no personal and/or privacy sensitive data registered.
- The information is anywhere, anytime and on any device accessible.
- It is applicable on multiple locations, making it possible to 'manage' multiple locations form a single system.
- Modular expandable with additional/ new applications.
